

Arogya Radar

Catching disease outbreaks early — and stopping medicine waste — across Gujarat

In one line: Arogya Radar watches the health of every area in Gujarat and warns officials about a disease outbreak days before it would normally be noticed — and shows where medicines are running out or about to be wasted.

The problem today

- Village and town health centres write their daily numbers on paper.
- Those numbers reach senior officials only weekly or monthly — too late to act.
- So outbreaks are noticed late, and medicines run out in one place while expiring unused in another.

What Arogya Radar does

- **Early outbreak warning.** When several centres in the same area report more fever or rash cases than usual, it raises a flag — days before a normal report would.
- **It looks ahead.** It projects where an outbreak is heading over the next two weeks and lists the medicines to move in now, before the surge.
- **Heat-wave early warning.** It flags dangerous heat days coming up and checks that centres have the ORS and fluids ready — Gujarat's own Heat Action Plan idea, built in.
- **Medicine shortage alerts and less waste.** It shows which centre runs out of what and when, and finds medicines about to expire unused so they can be moved to where they are needed.
- **A simple weekly summary** for officials, written in plain Gujarati, Hindi or English.

The clever part: almost no extra work for staff

People worry that busy health workers will not fill in yet another form. Arogya Radar is built so they mostly don't have to:

- Most of the information already exists in the government's own computer systems — the medicine supply system (e-Aushadhi) and Gujarat's own TeCHO+ health platform. Arogya Radar simply reads it.
- It can even spot an outbreak just from how fast medicines are being used — without anyone reporting a single patient.
- For small centres with nothing digital, a worker sends a 30-second voice note in Gujarati, or a photo of the paper register they already keep. No typing.

Rs 0

cost to run the trial

6 weeks

length of the trial

~9 days

earlier outbreak warning*

Rs 3+ lakh

medicine waste found*

* measured in a realistic test of Dahod district; the trial will confirm the real numbers.

Why it is safe to try

- It only **reads** information and gives advice. It cannot change any government record.
- It does **not** store patients' personal details — only daily totals.
- The government keeps **full ownership** of all data, hosted in India, and can stop any time.

The plan

- Start with a free 6-week trial in one block of **Dahod** district.
- Measure one clear result: how many days earlier an outbreak is caught, and how much medicine waste is prevented.
- If it works, expand across Gujarat — one district at a time.

What we are asking for

Permission to run the free 6-week trial in one block of Dahod, and a short meeting to show the working system — which already covers all 33 districts of Gujarat, live on Dahod today.
